Annual Recommendations (please check all items you'd like to discuss during your visit with us):

- FVRCP (Feline Distemper, Rhotracheitis, Calicivirus Vaccine).** This vaccine protects your cat from many common viruses that they are exposed to all of their life. This vaccine contains the following: Feline Distemper, Rhotracheitis, and Calicivirus Vaccine. These viruses can be brought into your home as a result of contact with contaminated environments. The vaccination is cost effective insurance that your pet will not become ill and require extensive and expensive treatments.
- Feline Leukemia Vaccination.** This yearly vaccine protects against the Leukemia disease. Cats can be infected by the saliva of infected cats contaminating the eye, mouth, and nose membranes of non-infected cats via licking, by passing infected blood to non-infected cats or from mother to fetuses (developing kittens) during pregnancy. While it is more common in outdoor cats, it is often seen in door cats as well. Your cat is considered "at risk" for leukemia if he or she spends ANY time outdoors, supervised or not. Yearly boosters comprise the best prevention program.
- Rabies Vaccination.** Rabies is always fatal (animals and humans) when contracted! Since there is no cure, prevention by vaccination is the only solution. Vaccination is extremely important AND highly recommended, as humans can transmit Rabies easily.
- Feline Leukemia/ F.I.V. Test.** The blood test is mandatory for kittens in our pediatric program. We will periodically screen older cats for these diseases. This is commonly done if the cat is sick, the test was never performed, or testing was performed but the Feline Leukemia vaccine was not given. Current opinion suggests that this virus may be harbored in some cats in a "dormant" state that may become active later in life. Consequently, a multi-cat household is a greater risk especially when adding young kittens.
- Intestinal Parasite Screen.** Since some internal parasites can infect people, yearly stool tests protect both your pet and your family. There are 12 common intestinal parasites that your pet may be exposed to on a regular basis. Dogs put all sort of things in their mouths. Therefore, it is important to check annually for parasites. The test is performed by examining a small quantity of stool through a microscopic flotation exam to identify characteristic parasite eggs.
